trying to install XAMPP on OSX 10.8.3, but for some reason, it seems to be listening on port 443 and trying to use that port to connect  
to phpmyadmin. Port 8080 is in use by my mac, so I can't change the port on XAMPP to make it listen to 8080, but I also can't make it  
listen on 443. I have my /etc/apache2/ports.conf file as follows: NameVirtualHost \*:80 NameVirtualHost \*:443 ServerName  
mydomain.com DocumentRoot "/Applications/XAMPP/xamppfiles/htdocs" ServerName mydomain.com DocumentRoot  
"/Applications/XAMPP/xamppfiles/htdocs" If I run a simple request like it works, but when I request it just serves the index.php page.  
Any ideas on how to make it listen to port 8080 instead of 443? A: Try removing NameVirtualHost \*:443 from your ports.conf file.  
Also, try using this file instead of ports.conf, as that file is meant to be used in Apache 2.4 and not Apache 2.2: Field of the Invention  
This invention relates to a method of

advantage of the live-mapped displays of  
several high-resolution monitors? I have a  
single Macbook Pro running Yosemite with  
4 high-resolution (2480x1440) monitors.  
I'm comfortable enough with my ability to  
use this setup as a normal working  
environment. However, I'd like to find a  
way to take advantage of it to make things  
quicker/easier/better. Currently I am  
running OS X Mavericks, but I'd like to  
switch over to Yosemite when it's out.  
Things I'd like to do: Move the windows

---

between the four monitors quickly and easily (think switch-pane) Have quicker access to several files at once, so I can access and compare details of multiple files in one folder Have access to several open documents (and their windows) all at once Any apps/macro/power tool or combination thereof to make this easier? A: I have a setup that works like this, and it works well. I have four 24" monitors, and I have
