Help me out. Thanks. Q:

$\mathbb{P}(\sup_i Y_i < \infty)$  implies  $\mathbb{E}[\sup_i Y_i] < \infty$  the probability that there exists  $i$  such that  $\sup_{j \leq i} Y_j < \infty$  the sequence  $\{Y_i\}_{i=1}^{\infty}$  eventually takes a value greater than  $z + \epsilon$  almost surely. Hence

the expectation is also finite. I am having a hard time proving the case when  $z=0$  is satisfied by

assumption. Define 
$$T_i := \sup_{j \leq i} Y_j$$
 ( $i \in \mathbb{N}$ )

Consider  $\lim_{i \rightarrow \infty} \mathbb{P}(T_i \leq z)$ . Note that

$$\mathbb{P}(T_i \leq z) \leq \mathbb{P}(T_i \leq z; A) + \mathbb{P}(A)$$
