Treatment of DNA with a growing number of chemical modifications has led to a wave of exciting synthetic approaches that will impact on a wide variety of fields in biotechnology. However, most methods employed to incorporate chemical modifications into oligonucleotides are not universally applicable to different types of nucleobase and backbone modifications. Here, we report a synthesis of peptide nucleic acids (PNA) comprising peptide units and phosphate groups in a straightforward and scalable manner. Each peptide unit was synthesized as a dipeptide unit using standard Fmoc solid phase chemistry and, in the final step, the dipeptide was further elongated by a semiautomatic on-resin procedure. The yield was ca. 50% and excellent dipeptide homogeneity (95-100%) was observed. The resulting PNA oligomers were all readily deprotected to obtain homogeneous PNA compounds. Biological and biochemical investigations indicate that PNA oligomers with a good antisense activity against complementary RNA can be synthesized in a rapid and inexpensive manner.i's ship > Ais Bataiti Archery Marksman Course, Lekpam, Sapta Kanya Devasthanam > Chhatri / Bundi Anantmah Swarupa Deshbandhu Dharamchari Maharaj
