MIDL history Autodesk first developed the MIDL (Meta-Object Description Language) specification in 1991 for creating software application interfaces. The company had been using an existing computer language, the DDE (Dynamic Data Exchange) development platform, to create its own software. AutoCAD history AutoCAD was released for the Apple Macintosh in 1984 and was one of the first CAD applications to make extensive use of mouse-driven menus and windows. The first version of AutoCAD was developed by Autodesk's Chuck Jakob and John Pringle and ran on Apple Macintosh II computers. It was the first commercial desktop application to be released to the public, and the first to run on the Macintosh. AutoCAD features Before AutoCAD was introduced, most commercial CAD programs ran on mainframe computers or minicomputers, with each CAD operator (user) working at a separate graphics terminal. AutoCAD was the first of these desktop applications to support vector drawing and the first to support tessellation (referred to as subdivision in AutoCAD-speak). It introduced real-time collaboration, the ability to share design ideas with a team of colleagues, with an enhanced drawing environment (graphics windows and menus). The first version of AutoCAD, released in December 1982, was considered to be a watershed product in the computer industry. By the end of 1983, AutoCAD sold over one million units and is estimated to have been responsible for the creation of 200,000 new jobs in the United States. AutoCAD for Windows AutoCAD for Windows, released in December 1997, was the first version of AutoCAD to be released for the Microsoft Windows operating system. in the year 2001, the AutoCAD design software was released which received awards at the same time as the Windows XP operating system and Microsoft Internet Explorer 6. Also in the year 2000, Autodesk released version 2000 of AutoCAD software which marked the introduction of the User Interface (UI) concept. The main premise of the UI was to allow users to work more comfortably with the software by eliminating the need to repeatedly adjust the current display location of objects in a document or view as well as the minimizing of the need to re-enter commands or data. The new UI also allowed a user to "focus" on a specific task at hand, even when working with multiple documents or views. This principle is still considered as the major concept of the UI. A further advantage to the new UI concept was that the software was less susceptible to file corruption. When using the workbench with the new UI concept, one can choose which command-line commands to execute in the background. Commands can be executed either in the foreground or the background, which allows one to temporarily suspend the command from execution. The temporary suspension of a command allows one to focus on other, more important, tasks while keeping the command execution running in the background. The temporary suspension of commands is more common with the web-based interface. Also in the year 2000, Autodesk released 2D image technology, PDF, and 2D plotting technologies. The PDF was for creating charts or plots from AutoCAD and was an open standard that allowed generating PDF files from any application that was capable of exporting graphics. This technology was first developed and released for AutoCAD Architecture by Autodesk and was the base for their entire product line. The 2D plotting technology allowed users to create vector graphics, such as lines, arcs, circles, ellipses, and splines, from any application that was capable of exporting graphics. This technology was first developed and released for AutoCAD Architecture by Autodesk and was the base for their entire product line. In the year 2000, Autodesk released a web-based toolbox which was a way of providing context sensitive help.
