Description of the Related Art Fluid pumps or motors are known in a variety of forms, depending on the type and structure of the moving or rotating elements and whether the fluid is a liquid or a gas. The pumping or driving element, which is often called a “piston,” can be of spherical, cylindrical, elliptical or otherwise arranged shape, with the piston being moved axially inside a cylinder, but also with the cylinder being moved axially with respect to the piston. The non-round or irregular shape of the piston can also be adapted to the shape of the receptacle or of the fluid to be moved. A better mixing of the fluid and of the moving element can be

achieved with a rotatable and/or circular piston and a cylinder with a rotating inner surface. The pistons are positioned at a known distance from each other along the longitudinal axis of the cylinder, in order to allow a constant spacing of the pistons in the sealed cavities, or the injection of the fluid to be moved into the cavities, where a heating of the liquid, however, can be applied. When the piston is in a heating station, its shape or structure changes. However, these changes are not covered by the above definitions. Two known embodiments of fluid pumps or motors comprise two pistons 55cdc1ed1c
