It comes in handy for scenarios where currently running applications freeze and need to be quickly terminated. Quick setup and systray accessibility Installing this utility is a fast and easy job that shouldn't give you any trouble. Once launched, Unfreeze creates an icon in the taskbar notifications area and sits there silently without interrupting your regular PC activity. Opening its right-click menu gives you the possibility to restore the main configuration panel, power off the machine, and exit Unfreeze. Set hotkeys for window termination and PC shutdown The primary panel contains two default key combinations for killing the active window and shutting down the PC, respectively. You can leave them as they are, turn them into anything else, as well as restore settings to default if you

change your mind afterward. Apart from the fact that the app can be sent to the system tray with the click of a button, there are no other noteworthy options available here. Evaluation and conclusion We haven't come across any stability issues in our tests, thanks to the fact that the program didn't hang, crash or show error dialogs. As we expected, it had minimal impact on the overall performance of the machine, running on low CPU and RAM. On the other hand, it comes loaded with a basic set of features that doesn't justify the price of the registered package. We must also keep in mind that it hasn't been updated for a pretty long time. Otherwise, Unfreeze gets the job done, providing users of any experience level with an effective method for terminating hung windows and powering off the machine via hotkeys. Ronnie Ojeda has a

Self-rated health and the number of health difficulties: a population-based study in a rural area. This study examines the cross-sectional association between health-related quality of life (HRQOL) and the number of health difficulties in a rural community. A sample of 18,782 adults living in the greater Tarrant County, TX, Area was selected using a clustered random

sampling approach in 1998. Analyses examined the association between HRQOL (tertiles) and self-reported number of health difficulties in Tarrant County, TX, Area. The prevalence of persons with a self-reported health problem was greater in men than women. Persons with 3 or more health problems had significantly lower HRQOL than those with no problems; persons with 4 or more health problems had significantly lower HRQOL than those with 1 or 2 problems. Age was related to the number of health problems reported; increasing age was associated with a reduced likelihood of reporting no problems or 1 health problem and an increased likelihood of reporting 4 or more health problems. BMI did not distinguish persons who had 3 or more health problems from those with fewer health problems. Multivariate regression analyses were performed to test the possibility that socioeconomic status (SES) confounded the association between number of health problems and HRQOL. In the multivariate models, the trend of the crude association between number of health problems and HRQOL persisted. The association between self-reported health and the number of health difficulties was present in an underserved community. The results suggest that the number of self-reported health problems may be related to various dimensions of SES./* Copyright Joyent, Inc. and other Node contributors.
