### What's New In?

Microsoft Power Query for Excel is a software solution for those who are looking to discover data across various sources, transform it and then shape it further for their applications. By using this software solution, you'll be able to identify the data you're interested in from sources including relational databases, Excel, text and XML files, OData feeds, web pages or even HDFS. Once you've discovered the data that you care about, you'll be able to search for it across all of those aforementioned sources - provided the data has been included in the original source, then that's enough to use it in Excel. The rest of the process of transforming data from one form to the other is done using a number of tools offered in Microsoft Power Query for Excel. The data transformation can be performed for specific data type(s) - for example, you can choose to only transform numbers - or you can turn all of your data into numbers, regardless of the data type it's been previously been processed in. In addition to data transformation, this solution offers a number of analytical tools that allow you to both perform aggregate calculations and work out various analyses and discover new insights by bringing your data together. For example, you can find the average by using Excel, as well as identify which results fall below a certain value, which can then be used in further analysis such as identifying individuals or creating reports or dashboards. You can also discover new insights by checking Excel's data by using various calculations, for example, running total calculations or matching a column with a column or even using a column from one table to search for a string inside another column of data. Microsoft Power Query for Excel Tools: Microsoft Power Query for Excel includes a number of pre-installed tools that can be used to shape and transform your data. For example, you can find great ways to clean data - doing things such as removing data that falls outside of a certain interval, fill in missing values and finding duplicates - or unifying and eliminating duplicates. There's also a number of tools that allow you to discover new insights by working through your data. For example, you can find a range of formulas you can use to clean up data, calculate a running total or find the average. To make sure that your data is properly cleaned, for example, you can use formulas that make use of a number of formulas such as =IF() and &, as well as arrays and table functions.
