The most common Photoshop tasks include: Creating Photoshop is used for creating raster images in various sizes. Images can either be created using a scanner or a camera, though most are created with a camera. Almost every digital camera has a built-in editing feature, so it is easier to create an image, which is saved directly from the camera, then manipulate the image for particular purposes using Photoshop. Instead of the built-in camera editing features of most cameras, Photoshop provides a more flexible tool. For example, users can apply a color filter to an image, or apply the canvas crop tool to select particular portions of an image. This tool allows users to select any part of the image on which they want to work. Cropping This is

the process of selecting an area of an image to work on using the Rectangle tool. The selection shape is created by typing in the corners using the Rectangle tool or using the guides from the edge of the image. Once you have selected an area of the image, it is easy to edit the selected area by altering the shape using the Selection tool. One popular use of this tool is to trim an image down, or crop it to a particular size.

Drawing and painting

Perhaps the most creative tool in Photoshop is the Pen tool. As you drag the mouse, the Pen tool moves around the screen, creating different shapes. You can use the shape to draw over an area, change the outline, or move it, and you can manipulate the path to adjust it, such as create a bevel. One of the best ways to use this tool is to create new layers, which you can then paint onto with

different colors, brush styles, and line widths. You can also use different settings such as Gaussian blur or use various brushes to apply textures to your image. One of the best ways to learn how to use the Pen tool is to watch a short tutorial on YouTube. Other drawing tools include the eraser and the Move tool. With the eraser, you can erase old shapes and areas, or you can draw new shapes on the image. With the Move tool, you can drag to reposition any object or shape. The Mousse tool can create 3D effects in your image. Adobe calls it Mousse because it mimics the behavior of foam. You can create these effects in Photoshop by using the Layer>New Mousse Layer feature

Adobe Photoshop is a professional standard

graphics editor used by photographers, graphic designers, web designers, Discord emoji creators and meme-makers. Note that for image editing tasks Photoshop (and other Adobe applications) uses a RAW (DNG) file format. Adobe Photoshop Elements is not compatible with the RAW file format. A RAW file is a technically complex file format that gives the same power as a digital negative. RAW files allow a RAW (or DNG) file to be edited for subsequent image processing in Adobe Photoshop or Adobe Lightroom, which will preserve the quality of the image. RAW file formats allow images to be displayed on the screen at their original size and quality and to be printed at high resolution with maximum fidelity. They allow colour correcting, sharpening, and other in-camera editing functions. The term 'RAW'

is derived from the fact that the image remains in its original state after the photo-editing processes are completed. The only way to get RAW files is if the camera actually uses the RAW file format. Most cameras do not use the RAW file format because many cameras cannot store and process enough data to make a RAW file. However, many cameras do have a RAW mode (e.g. the Canon EOS-1D X). The image will be in a proprietary RAW file format which has to be converted to Adobe Photoshop's native file format before further processing in Photoshop Elements. However, not all RAW files are identical. There are two different ways to create a RAW file. The first way is to use the proprietary RAW file format of the camera, which is the default way most cameras store a RAW file. The

second way is to use a RAW converter program to convert the RAW file to Adobe Photoshop or Adobe Photoshop Elements' native file format. There are a number of RAW converters, including those included with Adobe Camera Raw, RawTherapee and Lumenera which allow you to save the RAW file as a DNG file. The RAW file is inherently higher quality than the processed JPEG file created by the camera or by the application which you used to view the image. RAW files are not the only type of file which can be saved in the RAW file format. An example of this is a Photoshop DNG file created in the RAW editor, or an image compressed with EXIF data converted to a RAW file format by a RAW converter. These are all file formats that are higher quality than an image saved as a JPEG file
