KEYMACRO 1.4 has a rather simple function: count the number of keystrokes. Feature: Keymacro provides the following basic functions: A) Recording the last 30 seconds of keystrokes (start/stop time); B) Counting each keystroke of a certain period (in minutes, seconds or seconds and fractions of a second); C) Checking the performance for the last 30 seconds and calculating the standard deviation; D) Counting and analyzing many keystrokes; E) Recording each keystroke and timestamping it; F) Counting the most used functions and handling the most used ones; G) Calculating the overall average value of the last 60 keystrokes, which are not counted; H) Displaying the keystrokes at the moment of activation; I) Outputting the function log by recording the last 10 keystrokes; J) Saving the log data by default; K) Changing the record mode (counting the last keystrokes, etc); L) Changing the default key to the right most button (for using it more intuitive); M) Automatically restoring the default key; N) Recording the keystrokes and timestamping them for each function; O) Saving the logs by default; P) Saving the logs by file name; Q) Number of average keystrokes and standard deviation And more functions listed in the manual. When you save the data on a local disk, you can also load it from the disk without having to close and open the program again. You can record keystrokes for one period or for a long time. The program will calculate the standard deviation for you. You can save the data on the disk, the hard disk or even the floppy disk. You can load the data from the disk when you open the program next time. You can output the data at the moment of the activation or in several different ways. To avoid overwriting the original log file, you can output the log to a separate file. You can also output the log by printing the specific keystrokes on the command line window. You can specify the key that should be the default key. The program can count the number of functions that are called most often. You can view the log data in different ways (on the screen or on the command line window). You can view the keystrokes that you recorded in different ways, for 77a5ca646c

Scholars have long speculated that subdomains of personality are related to particular levels of Maslow's hierarchy. In line with that, recent research shows that motivation plays a key role in understanding the stability of personality traits over time. The present study is the first to explore whether subdomains of personality correspond to different levels of Maslow's motivation. Using a sample of 499 participants, the authors tested whether the facets of the Revised NEO Personality Inventory correspond to different levels of the Self-Determination Theory. Results showed that subdomains of Conscientiousness, Openness, Extraversion, Agreeableness, and Emotionality corresponded to different levels of the Self-Determination Theory. Findings suggest that the domain structure of the NEO Five-Factor Inventory is meaningful in terms of the Self-Determination Theory and that personality traits may be dynamic not only as a result of external experience.
