\* \*\*Photoshop Elements:\*\* Adobe Photoshop Elements is the company's entry-level image editing and retouching software. Elements includes most of the features of the professional version of Photoshop as well as tools found in the casual imaging programs. Because it lacks the professional color tools found in Photoshop, Elements is best for easy-to-share retouching. ## Layer Style You can modify the look of a single layer to create interesting effects. In the Layers dialog box (Figure 9-4), you can choose an item to modify, such as Layer Styles or Gradient Overlays. You can also choose to apply one of the effects from the Effects panel. Figure 9-4. The options in the Layers panel affect all the layers in your image at once. Don't be surprised to see the word "Layer" in the menu column—you can apply Layer Styles to the image as a whole. ## Effects Photoshop's effects are similar to those you find in the Effects panel in GIMP (see the box on this page). Photoshop's filters can produce artistic effects and even add effects normally associated with 3D programs, such as glass, crystal, or smoke. Many of Photoshop's effects are based on those you see in other filters, including the ones in GIMP (Figure 9-5). Some of the most common effects you might expect to find in GIMP are there in Photoshop. Two of the most popular filters are the Glow Filter and Soft Light Filter. In addition, you find the Photoshop-only Highlight and Shadow effects. Figure 9-5. The regular and Grainy types of Grain are found in GIMP too, as are the Blur and Posterize filters. The difference between the regular and Grainy versions is subtle but handy to know: with the Grainy version, you get the same effect as blurring the photo. ## GIMP Filter Effects The Filter Effects window is a bit like the Effects window in

Photoshop. Like the Effects window in Photoshop, the GIMP window has a number of categories—quite a lot, really—of effects (Figure 9-6). Most are self-explanatory and very similar to the Photoshop filters. However, one huge difference is that you can edit the opacity of many effects, or lighten them as if they were photographs.

Using a Gaussian blur, you can control how much to blur an image. And

“I have some bad news and some good news,” this guy says on film as he slides a large box to the doorstep. “The bad news is it will be going to the dump. The good news is it’s going to the dump in a new truck.” Oh Lord. Thank God it’s going to the dump. He carries it down the steps and around the corner to the dump truck. But I wonder if he didn’t really have a good reason for saving it. And that truck is going to be in his yard for, oh, say, seven to 10 years. He’s got plenty of time to make up his mind about this thing. I mean, look at it. It’s a box. It’s got a lid on it. It’s got a handle. It’s got wheels on it. It’s a perfect crate. But how can this be the object that started an exciting movement for a kid who was so out of place that he came from the land of no computers, no cheese sticks, no pizza, no girls? It’s from my now-older sister. A few years ago she stopped by with a friend, and they thought this was just a blank box, a beer crate that needed to be transported to the dump. They’d seen boxes on TV and thought it was an easy way to get rid of something. I was at home at the time, and I don’t think they could hear my laughter over the sound of the truck cranking up and away. They didn’t get it. The rest of this tale can wait until you check out the rest of my project. As for 2019, the World Congress of the World Psychiatric Association is being held in Seoul, South Korea. In the history of the World Congress of the WPA, it has been held for one time only in Korea. However, it is not the first time in which South Korea hosts a World Congress of the WPA. Although a number of delegates from the WPA are invited to Korea, the situation for the accommodation of delegates is quite different. There are various problems in accommodation for delegates, such as the problem of short-term accommodation

systems. The use of the polymerase chain reaction (PCR) has made it possible to extract DNA from many samples without the need for microscopic examination. The fluorescence-assisted sample preparation (FASP) technology for DNA extraction and purification, based on magnetic bead purification, was further modified with unsupervised operation. With this system, more than 100 samples can be processed simultaneously. Samples can be placed into the wells of 96-well-tubes and DNA isolated within 2 h. The efficiency of DNA extraction was compared to protocols based on silica columns, silica beads, magnetic beads, and magnetic beads modified with magnetic nanoparticles. The only limitations to the application of the FASP technology lie in the use of tubes, and the formation of bubbles in the tubes during pre-mixed PCR reaction. Similar levels of DNA recovery were obtained in comparison with silica column-based kits and magnetic beads or magnetic nanoparticles. The study indicates that, in contrast to magnetic beads or magnetic nanoparticles, magnetic beads chemically modified with magnetic nanoparticles provide greater DNA recovery. Because the purity and yield of DNA preparation is the most critical step in molecular biology, the new system may be suitable for small scale DNA analysis.
