The Hyper-V Switch application allows you to toggle between running Hyper-V or natively on the system in one click. This gives administrators the flexibility to run Hyper-V on their systems and disable it on the fly or simply disable it entirely and boot directly into Windows. The Hyper-V Switch is a stripped down version of the default Hyper-V role. It does not contain the legacy Hyper-V features like the Hyper-V console, the Hyper-V Management Console and the Hyper-V Virtual Machine Manager. Hyper-V Switch Installation: The Hyper-V Switch installation is pretty much the same as that of the Hyper-V role and requires you to go through the normal role installation process in order to enable the role, which in turn will enable the Hyper-V Switch application. If you already have installed the Hyper-V role on your computer, you will find the Hyper-V Switch application in the Control Panel. The problem you are having can be attributed to the fact that your computer has two network cards. The first is a built-in Microsoft virtual network device that is activated at boot by the Hyper-V role. The second is your NIC, that you have connected to the network. The error "Network adapter driver not loaded" is a bit of a red herring. Since the Windows fails to boot because of the Hyper-V role, any sort of error in the booting of the operating system is simply part of the symptom, rather than its cause. You can disable the built-in virtual NIC at startup by changing the boot configuration. The procedure is really quite straightforward, although requires administrative privileges. Sometimes it is worth giving a hypervisor - hypervisor a miss and just going straight to the operating system... I've been running Linux on my laptop with the built-in NIC for years. Of course, sometimes it is worth giving a hypervisor a miss and just going straight to the operating system, especially for newbies.
