I'm just getting started with MVC, and have been researching some OOB uses of the partial view mechanism. One of the answers to this question mentions the very common paradigm of creating a partial view to retrieve data for the display of an entire model, from a class or controller action. For example, say I have a "User" model that contains an "Email" and a "Password" string. I could have an action in my HomeController: `public ActionResult Index(User user) { var desiredEmail = "foo@bar.com"; var desiredPassword = "foobar"; user.Email = desiredEmail; user.Password = desiredPassword; return View(user); }` Then the client renders an email-only div with: `@Html.Partial("EmailOnlyPartial")` This clearly is not an OOB way to go about this. In fact, a partial view makes this problem much easier, and to my understanding, much less of a hack. However, I'm wondering about a scenario where this is the only way to go. For example, when I have a table that shows all existing entries in a database, and I want to quickly enter data into a page without having to populate every row on the page. If this was me, I would create a new class called "CreateNewUser" and have a class method with: `User newUser = new User(); newUser.Email = "foo@bar.com"; newUser.Password = "foobar"; return newUser;` Then I would use this data, perhaps in a partial view. Is this situation where I do not directly populate the full-model into the main view, but rather just display its properties correctly with the PartialView, correct, or is it a bad practice? I'm genuinely curious. If it is bad practice, what should I do instead? A:
