This invention relates to magnetic fields and more particularly to the recording of information on magnetic media by defining the bit pattern. One method of recording information on magnetic media is known as the non-linear transition array or "NLTA" technique. In this technique the media is magnetized in accord with the presence or absence of either magnetic poles. For example, to represent a "1" magnetic pole may be adjacent a first track, and a "0" pole may be adjacent a second track. In this manner the media may be magnetized, for example, as a pattern of alternate magnetic poles in accord with a bit pattern corresponding to a desired data signal. A portion of the media magnetized according to the pattern to represent a "1" may be sensed by a sensing device such as a transducer to provide an output signal representing the desired data signal. This technique, however, requires precise positioning of the magnetic poles relative to each other. Due to this relative positioning, the magnetic fields formed are fixed in the recording medium. Since the field strength may vary with the distance between the "0" and "1" poles, this is particularly true when the recording is made with a magnetically floating head which may be moved to a selected height above the magnetic media. While this technique may be used with a transducer on a separate head carrier, it is more commonly used with a flying head wherein the transducer is mounted on a flexible circuit ribbon which is positioned adjacent the magnetic recording media. This flexible circuit ribbon may be suspended in a suitable recording gap formed by the edges of the thin film portions of the magnetic disk. The most common recording gap is the "C" shaped notch formed by the narrow sides of the magnetic heads. These "C" shaped recording gaps are illustrated in pending application Ser. No. 430,734, filed Aug. 11, 1982, by Hamrick et al. and assigned to the present assignee. A typical configuration for an magnetic head is shown in FIG. 1. Such a head may be assembled on a suitable transducer carriage generally denoted as 1. The assembly is supported by an arm 4 which is movable in the radial direction of the magnetic media 5. It is necessary that the recording gap have a small air gap or clearance therefrom. The reason for this is that the normal air gap exists only where the air is stationary. That is, the air is moving in the path of motion of the tape. This is illustrated in FIG. 2. In such a

You will also learn how to use the colour tools to manipulate your image and how to use the selection tools to take ownership of an image. Topology types may be generally classified into local type and global type, according to the states of valence bonds in a molecule. The local type, in which no valence bond is in the molecule, is completely different from the global type, in which at least one valence bond is in the molecule. Local type has attracted attention in recent years because of recent advances in fields, such as materials for spintronics (frontiers of science), that require a physical property peculiar to only local type. In contrast, the global type has not been studied until recently. Local type may be classified into a type that is completely different from local type (global type), and a type that is not completely different from local type (semi-global type). In a semi-global type molecule, each bond is shared by different atoms and a valence bond is not included in a bond between the two shared atoms. Although a virtual local type that is not shared by different atoms may be defined, the state where all valence bonds are not included in a bond between the two shared atoms is not included in the semi-global type. Choi Yong-hoon was detained without bail for allegedly plotting to overthrow the government. By Ko Dong-hwan Suwon, Jan. 24 — The first phase of Choi Il-kwon's trial started on Jan. 25 at the Seoul Central District Court for his alleged treasonous act. Choi was arrested in a 2016 sting operation targeting North Korean agents who had attempted to infiltrate the military and topple the government of President Park Geun-hye, who was impeached earlier this month. Five agents were arrested in that operation, but Choi is the only one yet to be convicted after a March 22 hearing in Seoul and a May 14 hearing in Gwangju. Choi was said to be a trusted confidant of Park, who is on trial
