Description: mrdh.edu.in/jasony-cadilla-dedicated-to-mothers-in-premature-the-birth-of-a-saviorY-chromosome variation among the Ainu: variation in the Yq12b locus. The genetic diversity of the Ainu is unique in Japan. In this study, we analyzed the Y chromosome genetic variations in 18 Ainu individuals by using the PCR-RFLP method with 10 markers: SRY, DYZ1, YNZ22, DYS390, M111, M20, M167, M170, M223 and M27. The SRY, DYZ1, YNZ22 and DYS390 loci were monomorphic in Ainu males. The number of DYS390 alleles in the Ainu was similar to that in the native Mongolian Y chromosomes. However, SRY, DYZ1, YNZ22, DYS390 and M111-M170 types of the Ainu were different from those of the Mongolian Y chromosomes. The M167 type of Ainu was the same as that in the native Mongolians. The M167 type of Ainu corresponds to the Indo-Pacific R1a branch. In Ainu, three types of the DYS390 were found: DYS390-12T, -13T and -14T. These results suggest that the DYS390 locus may be located on an uniparental chromosome in the Ainu. To our knowledge, this is the first report of the intra-Yq12b variation in the Ainu.

There is `std::next` which returns the next iterator in the list pointed to by `t`. I noticed that this is taken as a "starting point" for a lot of algorithms. Is there a standard library or language construct that defines the next, same iterator? Or just some common pattern of behavior? A: You need to use `std::next`. `#include #include #include`

---

```
#include struct T {}; int main() { std::vector v;  
v.push_back(T()); assert(std::next(v.begin(), 1) ==  
v.begin()); }
```

Spectroscopic detection and thermochemical analysis of uranium oxide microemulsions induced by 1,4-diazabicyclo[2.2.2]octane. Abiotic scavenging of uranium in the ocean involves the formation of uranium oxide emulsion droplets composed of a mixed  $\text{NaNO}_3$ ,  $\text{Na}_2\text{S}$ , and  $\text{UO}_2\text{Cl}_2$  aqueous phase. Herein we propose a new
