Photoshop vs Photoshop Elements: A Crash Course In this tutorial, we will explore features of the Photoshop and Photoshop Elements applications that will prepare you to be a Photoshop or Elements power user. Both of these programs are graphic editors. Photoshop is a traditional photography software that also allows the creation of vector images such as illustrations. If the application does not do what you want, you can search for a plugin. Elements is a simpler replacement for Photoshop, as a graphic editor. It does not contain many advanced features. It is perfect for hobbyists and beginners. Before we begin, we suggest that you watch the below introductory video by the creator of Photoshop to learn more about the program, if you need to. Software Features While most of the software features of Photoshop and Photoshop Elements will be the same, here are some of the differences between them. Most Popular Photoshop Features With a little training, you will be able to use many of these features. For the most part, the features of Elements are easier to learn and use. If you are new to photography, Elements may be the better option. Edit existing images Photoshop allows you to load an existing image into the program, edit it, and save it directly. This allows you to cut and paste existing images into your design without having to spend the extra time to make a copy of the image. Elements allows you to paste an existing image into the program, but this does not save or change the original image. There is no way to duplicate images. In Elements, the user interface is simple. You can load an image from the computer or from a media source such as a camera, card or other source. Color modes In Elements, the color modes are simplified. Colors are called colors and modes are grouped by color, and they will not be grouped by other methods such as hue, saturation, luminance or any other mode. You can set your color to RGB, CMYK, or HSL if you prefer. To edit an existing image or create new images, click on the Create, Edit and then the Edit tab at the top of the program. Under the File menu, you will see options for Create a New File, Open and then Edit Images. Under the Edit menu, you will see options for Add Layer, Create a Bitmap Copy, Select, Make Clipping Mask, Modify and Reposition 05a79cecff

I was under the impression that putting async(GetUsers); at the top of my code would do it. This however, doesn't seem to work. It just makes a blocking call, but doesn't wait for it to return. private void GetUsers(final String email, final String displayName) { DatabaseReference mDatabaseReference = FirebaseDatabase.getInstance().getReference("Users"); ValueEventListener eventListener = new ValueEventListener() {
