

# SIMPLE TIPS FOR USING SUPPLY CHAIN MANAGEMENT

In today's business world, supply chain management is key. It is an integral part of any company's operations and can make or break a business. If you're looking for a way to increase your company's efficiency and productivity, then Oracle Applications Supply Chain Management may be the answer.

Oracle Applications Supply Chain Management is a leading supply chain management software that helps companies manage their supply chains. It allows you to automate various business processes, from purchasing, inventory management, and logistics to customer support and sales order processing. The Oracle Apps Supply Chain Management tutorial will teach you how to use the software in your organization.

## SUPPLY CHAIN MANAGEMENT PROCESSES

Supply chain management can be defined as the process of managing all activities related to the procurement, production, distribution, and sale of goods through an organization's supply chain. The supply chain starts with raw material sourcing to the point where products reach customers or end users. It involves multiple entities such as suppliers who provide materials needed for production, manufacturing facilities where goods are produced, distributors who transport goods from one location to another, and retailers who sell them to customers or end users at retail locations such as stores or online websites like Amazon or eBay.

The Oracle SCM solution gives you a single view of your entire supply chain, from suppliers to customers, from purchases to production to distribution across multiple locations. Using this solution, you can:

- ❖ Reduce inventory costs by forecasting demand accurately
- ❖ Reduce lead time by shipping only what is needed when it is needed
- ❖ Reduce operating costs through optimized inventory management
